

Software Installation

This is not a lecture but a guide for students to self-install the software used in the labs

Uninstall Existing Java/JDK

- Java Development Kit (JDK) is used in this course.
- Most of the problems faced by students are caused by unknowingly installed multiple versions of JDK or incorrect installation.
- Search "Java" or "JDK" in your app list.
- Uninstall all of them.
 - [How do I uninstall Java on my Windows computer?](#)

Software for Java Development

1. Java compiler: Azul Zulu JDK 23

➤ [Azul Zulu JDK 23 for Windows](#)

➤ Read the next slide for setting JAVA_HOME

➤ [Azul Zulu JDK 23 for Mac](#)

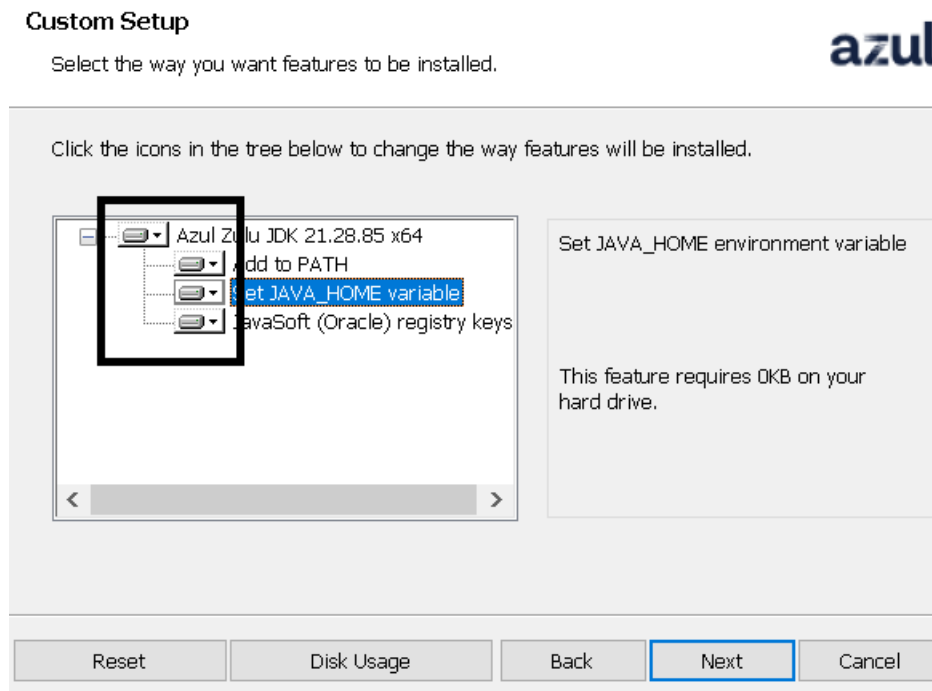

2. IDE: Visual Studio Code

3. Extension Pack for Java

JAVA_HOME

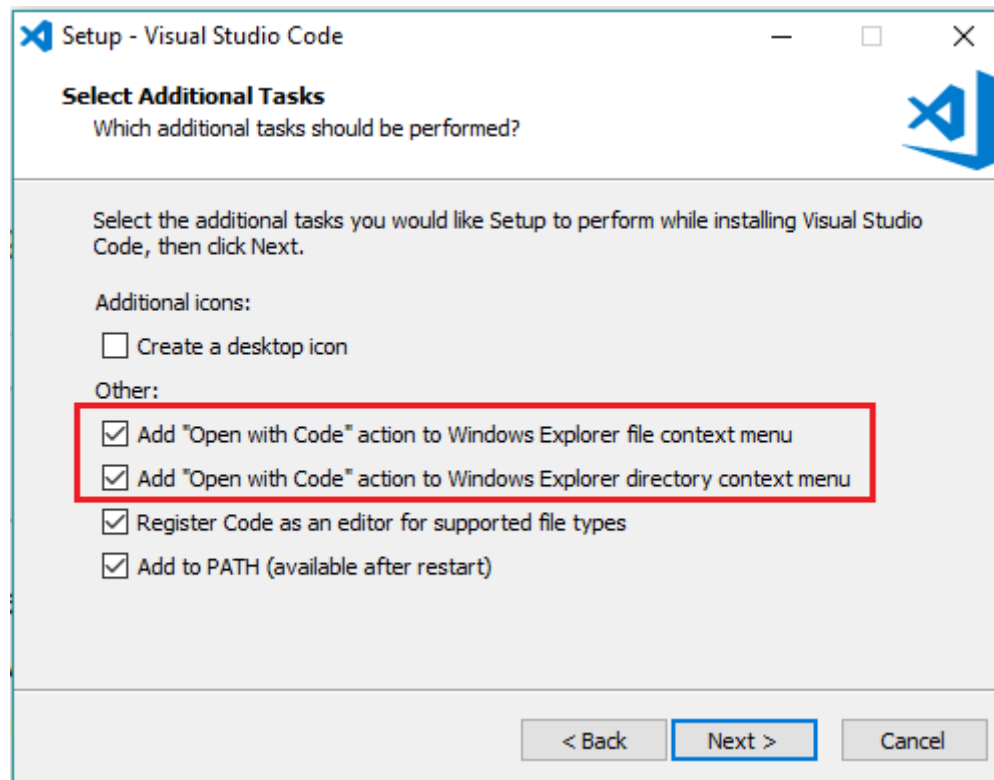

➤ Windows

- At the step below, change JAVA_HOME option to **Will be installed on local drive.**

Visual Studio Code

1. Download [Visual Studio Code](#)
2. Windows: Choose System Installer x64.
3. Tick **Open with Code** options as follows:

Extension Pack for Java

1. Install [Extension Pack for Java](#) in VS Code.

Test Your Installation

1. Launch VS Code.
2. Click **File** menu > **Open Folder**.
3. Select the **Code** folder.
4. Click **Welcome.java**.
5. Click **Run** menu > **Run Without Debugging**.
6. If there is no error, a **Hello world** message will be output.

Open Folder in VS Code

- In VS Code, a folder is a project. Hence, always use the **Open Folder** feature to open the folder containing your .java file.
- If you open a .java file directly without **Open Folder**, it may not work.
