

CSE6214 Software Engineering Fundamentals

Tutorial 13

Part A: Discussion

Topic (Lecture 13): Software Maintenance and Control

1. Describe the main elements of a project that must be monitored and controlled in order for the project to be progressing well.
2. Describe the types of changes that could happen in a software engineering project.
3. List the 3 broad categories of information that make up the software configuration.
4. What is a Software Configuration Management (SCM)?
5. Explain the importance of version control and change control in ensuring quality of the software product.
6. Describe the different types of maintenance activities after a software application has been deployed.
7. State a few reasons to perform software reverse engineering and software re-engineering.

Part B: Project

Task: Prototype presentation

1. Setup the system before the presentation.
2. Team leader quickly present the overall structure of the system.
3. Each team member then demonstrates the subsystem that is assigned to him/her. Use the acceptance test to demonstrate the functions in the system, whether the functions are completed or not.
